RESEARCH PROFILE

I am a computational immunologist specializing in spatial transcriptomics, T-cell state characterization, and donor-aware computational modeling. My research includes end-to-end GeoMx Digital Spatial Profiling across 16 micro-dissected regions of primary melanoma, uncovering depth-dependent antigen presentation loss (*JEADV*, 2022). In computational genomics, I analyzed 251,055 memory CD4 T cells from 64 donors using consensus NMF and developed custom UMI-aware, BAM-level Python code to resolve PDE4D isoforms, verifying signature recurrence across 702 independent atlas samples (held-out AUC 0.780; *Nature Immunology*, in revision). At Yonsei University Wonju College of Medicine, my postdoctoral research focuses on building multi-cohort skin and brain transcriptomic atlases to model the skin-brain axis, and I lead-authored a 548-page textbook on AI drug discovery (*PanmunEducation*, September 2026). At PB Immune Therapeutics, I built internal single-cell and spatial workflows. I would apply my experience in spatial immune profiling and computational analysis to the Vázquez-García Lab's studies of somatic clonal evolution and immune surveillance.
